User Experience Research of open.qq.com

Background

Tencent Open platform was a product that provided traffic and hosted third-party web games and applications. Companies or clients who use this platform also wanted to deliver advertisements, check data and add credit on it.

Project Process

User research

User interview
Usability test

Design

Low-fi Wireframes
Design Strategy

Ideation

Scenarios
Journey Map

Prototyping

Mobile page

Challenges

Product team wanted to develop mobile pages for an existing website, but they did not know:

- Does the third party really need a mobile version?
- What pages of the website should be refactored on a phone, if they need?
- What form of the mobile UI pages should be? An app, mobile pages or others?

Role and Contribution

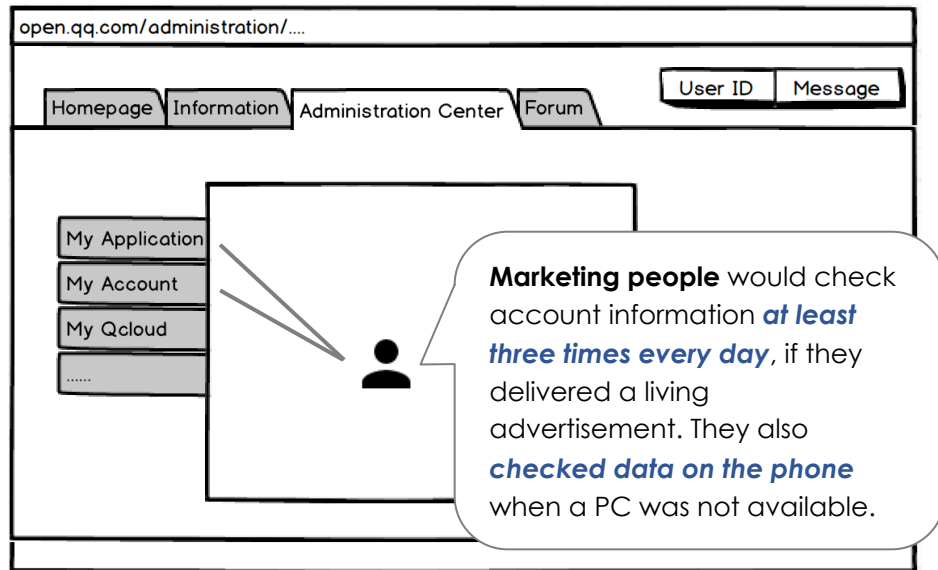

- Led and planned the research project
- Visited 8 third-party developing teams, and interviewed all roles who possible used Tencent open platform.
- Output research findings and provided design suggestions

User Research

User Interview

Talked with all people of the developer teams who were using open.qq.com, know

- Which positions had to use open.qq.com?
- Did they need mobile pages? Is that urge?
- Usage frequency, scenarios, how and why?
- Problems they met when they use it on phone?
- Did they use competitors?
-

Some positions, marketing people, product managers and even bosses, checked data on open.qq.com frequently. **They needed mobile pages.**

Usability Test

Set up tasks and observed how people did it, including on open.qq.com and competitors.

Task Example:

Today you delivered a new advertisement. Now you are waiting for a bus and feel boring, so you want to check the advertisement data on the phone. How will you do?

Checked data on open.qq.com by phone

Checked data on competitor's website by phone

Ideation: Scenario

Scenario 1: Before Sleeping

This man has turn off his computer and went to bed. He was used to playing smartphone for a while before going to sleep. He would probably take a look at the latest data about the advertisements to ensure no emergency or abnormal data.

Other Scenarios

Waiting for bus

Waiting for friends

On a taxi

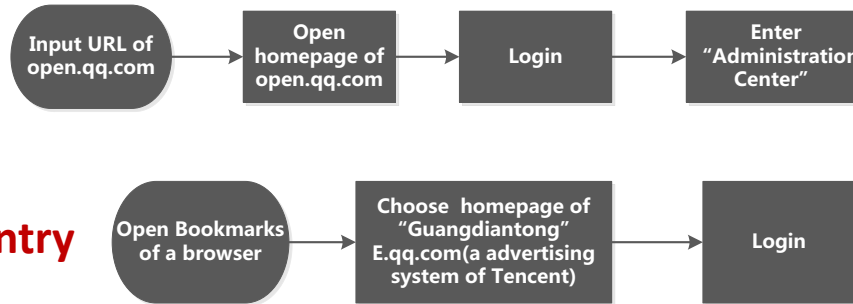

Scenario Feature

- All users want to know the latest data of their product, advertisements.....
- They do not have a computer turned on around them.
- They have smart-phones: iPhone 4s, SAMSUNG I8558...
- Such kind behavior was happened in fragmented time , also with some other things.

Ideation: Journey Map

1

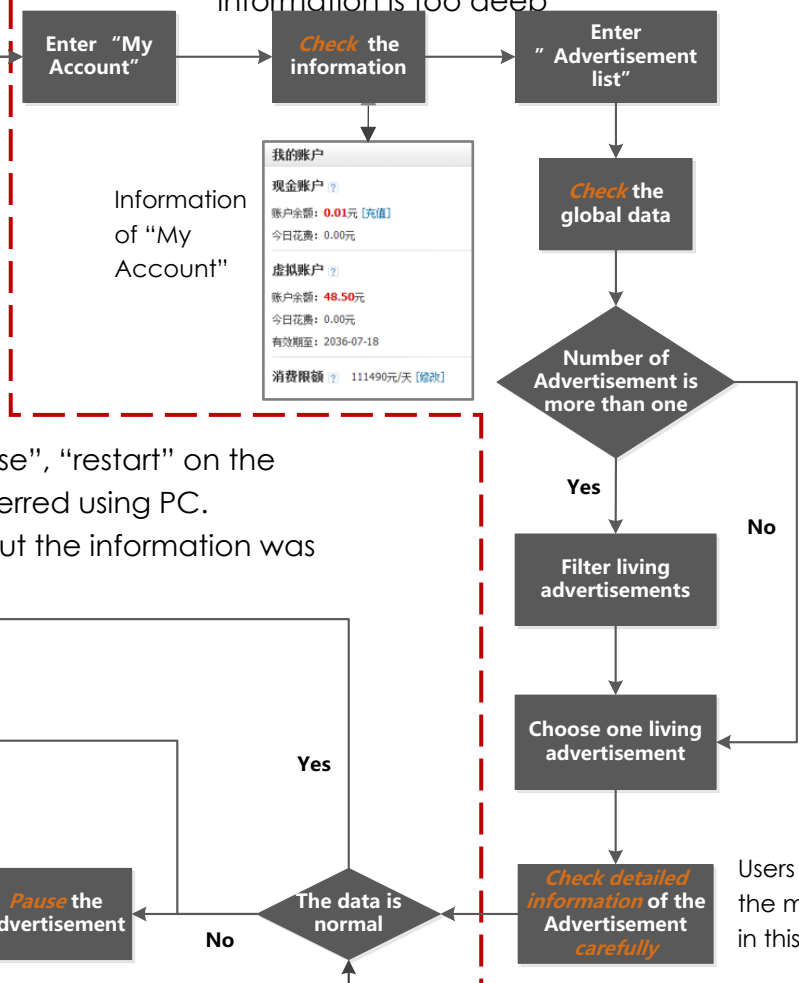

Users prefer to “**click**” button than “input” something.

Preferred Entry

2

- Browsing data was the main behavior on the phone
- The entry to the page of advertisement information is too deep

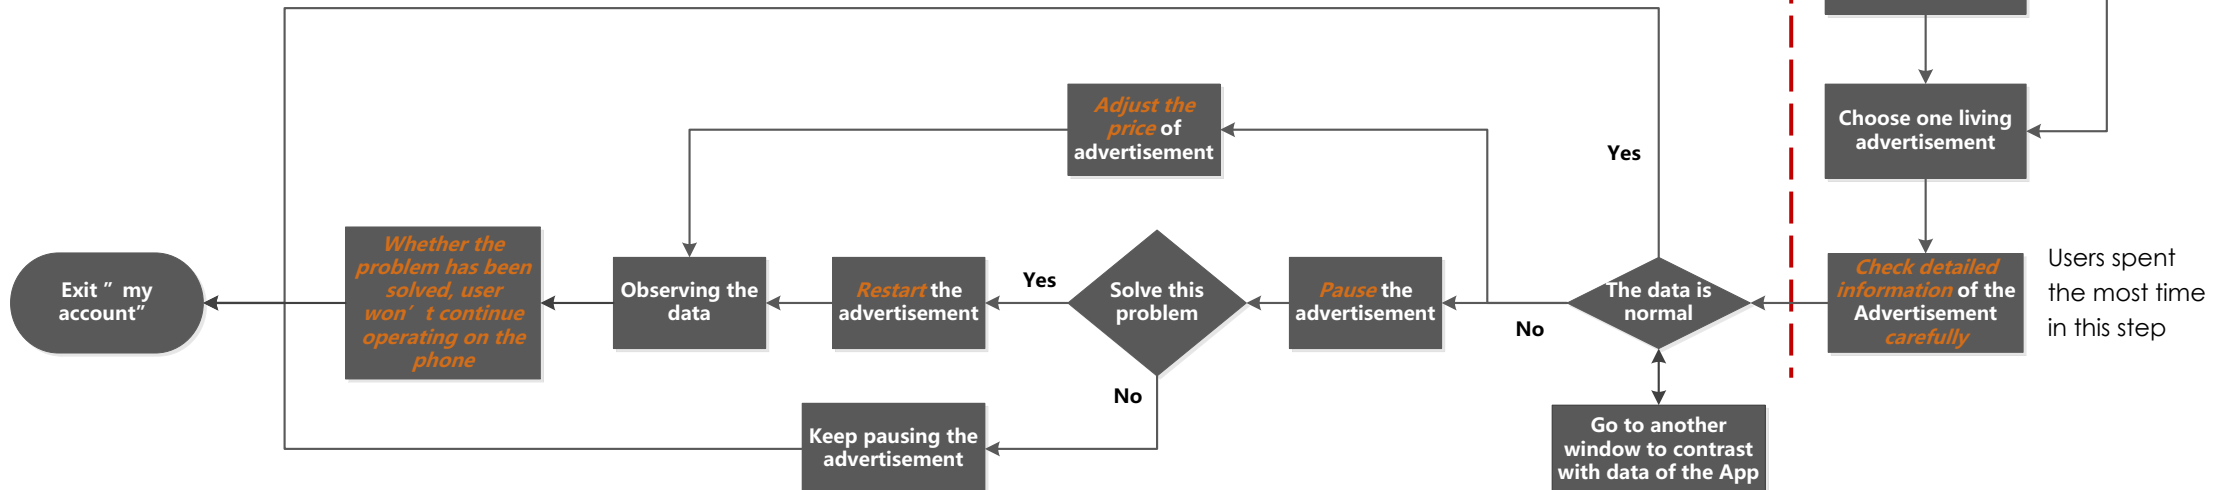

Information of "My Account"

我的账户
现金账户 ?
账户余额: 0.01元 [充值]
今日花费: 0.00元
虚拟账户 ?
账户余额: 48.50元
今日花费: 0.00元
有效期至: 2036-07-18
消费限额 ? 111490元/天 [修改]

3

- Users would do some **one-button** click, such as “adjust price”, “pause”, “restart” on the phone. If they have to do more complicated operation, they preferred using PC.
- Users leaned to contrast advertisement data with product data, but the information was in different pages. It was hard to checked both on phone.

Users spent the most time in this step

Design: Low-Fi Wireframes

After each interview, we also let **users drew wireframes** of layout, chose the information they expected to see on phones, which inspired designers create new design in short time.

Design: Design Strategy

Challenges

People preferred to “click” than “input” and would like to compare the data on different pages, so an app should be better than a WAP page. But the amount of users is very small, *developing an app was not worthy*.

So *what kind* of *mobile UI pages* should be?

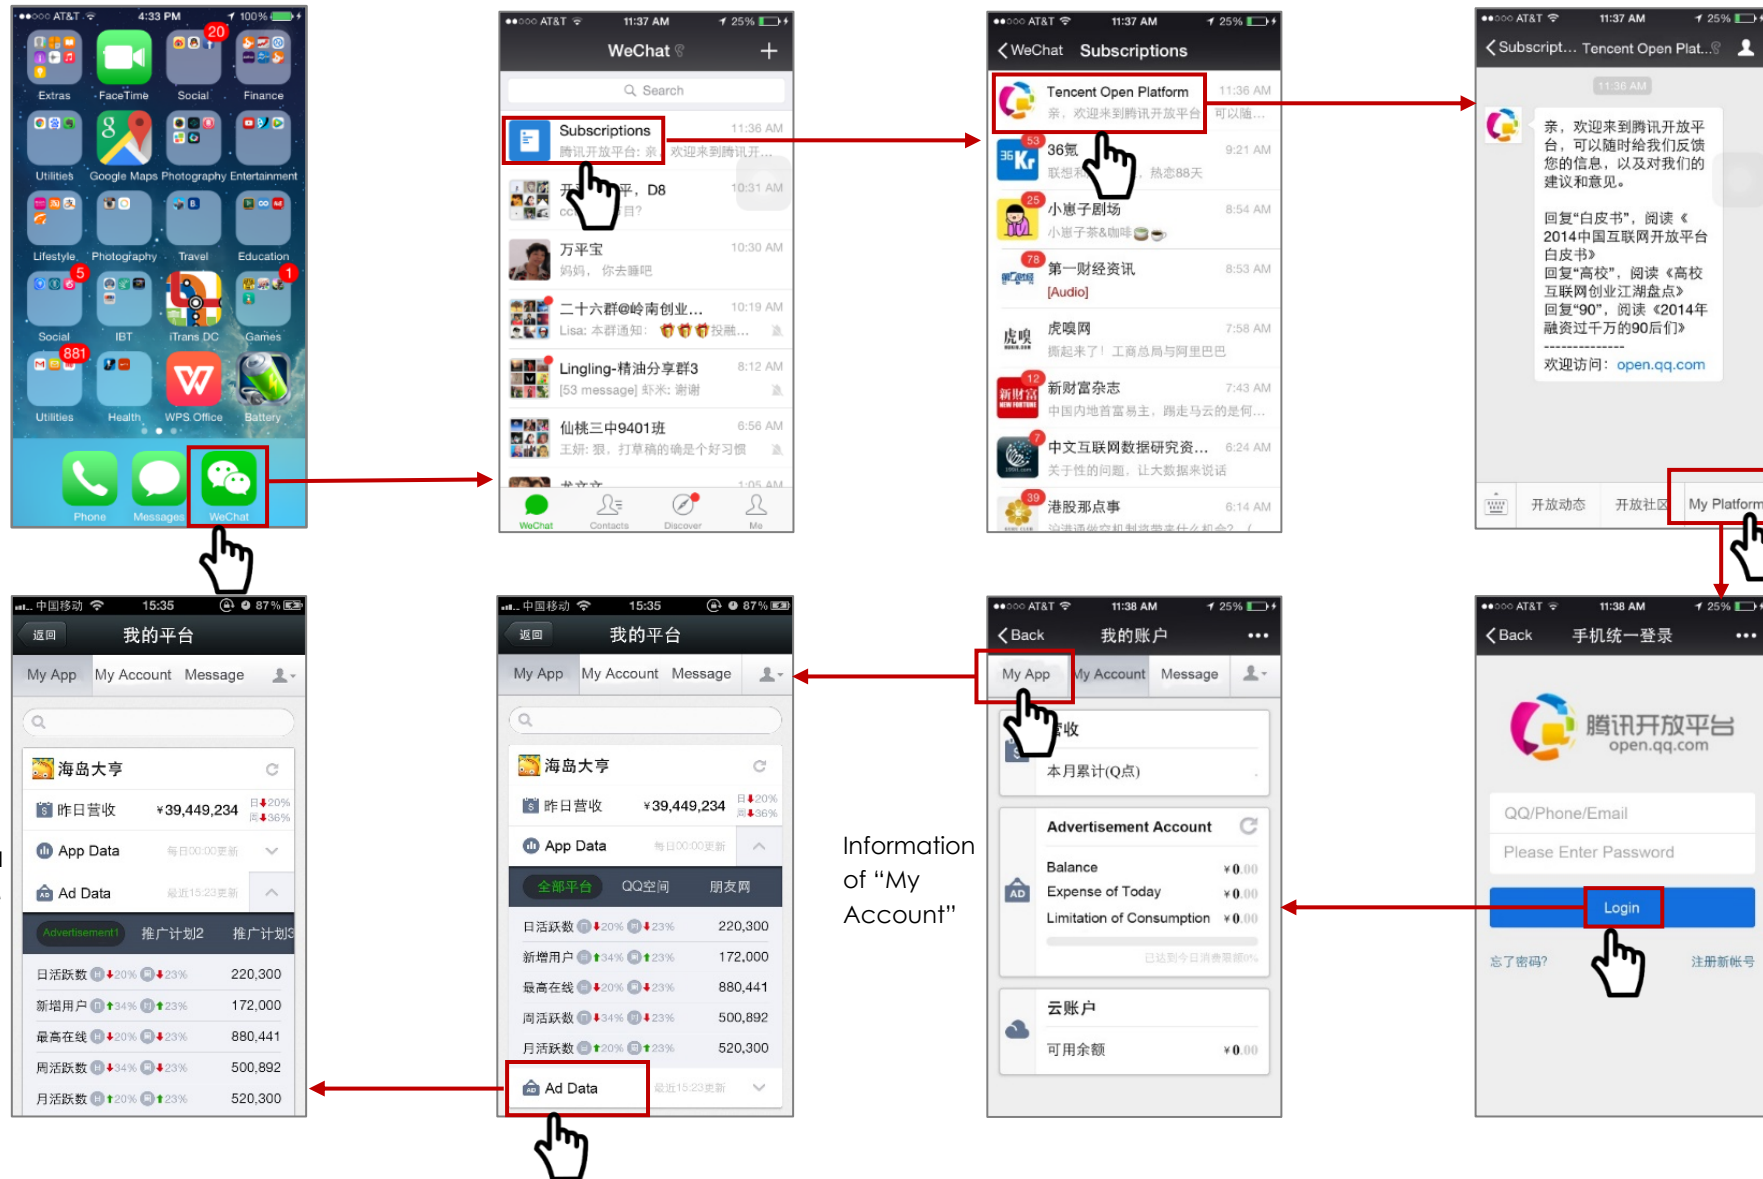

Method

- Combining with Wechat: open *a public account* which can display data.
- Provided the *information users expect to watch* in fragmented time
- Provide *simple* but *emergency* functions, such as “pause”, “restart”
- Put the *data* of *products* and *living advertisements* on *the same* page.

(Wechat, the most popular social network app of China, pushes information to users by “Subscription” then.)

Prototyping: Mobile Page

The End
